

AI Agentic Engineer:

Job description:

1. Define the tools required for delivering the use case
2. Rapidly iterate to POC technical capabilities and to validate the agent behavior with the client weekly
3. Build the prompts and other capabilities required to ingest and reason on data from SAP and non-SAP systems
4. Identify additional ways agentic capabilities can help deliver value for the client's need
5. Think creatively about use of SAP SuccessFactors, especially Employee Central data, and S4 data to inform talent decisions at a Japan-based client

Technical skills to be clarified

- 5–10 years of software engineering experience building cloud-native enterprise or SaaS applications.
- Hands-on experience building LLM-powered applications and agentic systems, including RAG, hybrid retrieval, and multi-step reasoning workflows.
- Strong experience with agent orchestration frameworks such as LangChain, LangGraph, MCP, or similar tool ecosystems.
- Experience designing prompt strategies, tool calling, and reasoning pipelines for enterprise AI agents.
- Strong programming skills in Python and modern ML/AI tooling, with experience integrating services using REST or gRPC APIs.
- Experience working with vector databases, embeddings, and enterprise knowledge retrieval systems.
- Experience integrating enterprise systems such as SAP BTP, SAP HANA, SuccessFactors, or other enterprise platforms.
- Experience rapidly delivering AI proof-of-concept solutions and iterating with customer feedback.
